

**ABSTRACT OF THE DISCLOSURE**

A wheelchair storage and moving assembly includes a housing  
5 having a top wall, a bottom wall, a back wall and a pair of lateral walls. A  
front side of the housing forms an entry into an interior of the housing. A  
door has a bottom edge, a top edge and a pair of side edges. A hinge  
hingedly couples the bottom edge the bottom wall adjacent to the entry  
such that the door may be positioned in a vertical position covering the  
10 entry or angled away from the housing and defining a ramp. A coupler is  
mounted on the door for selectively coupling the door to the housing in a  
closed position. A plurality of securing members selectively secures the  
housing to the vehicle such that one of the lateral walls faces the vehicle.
